

ATTENTION

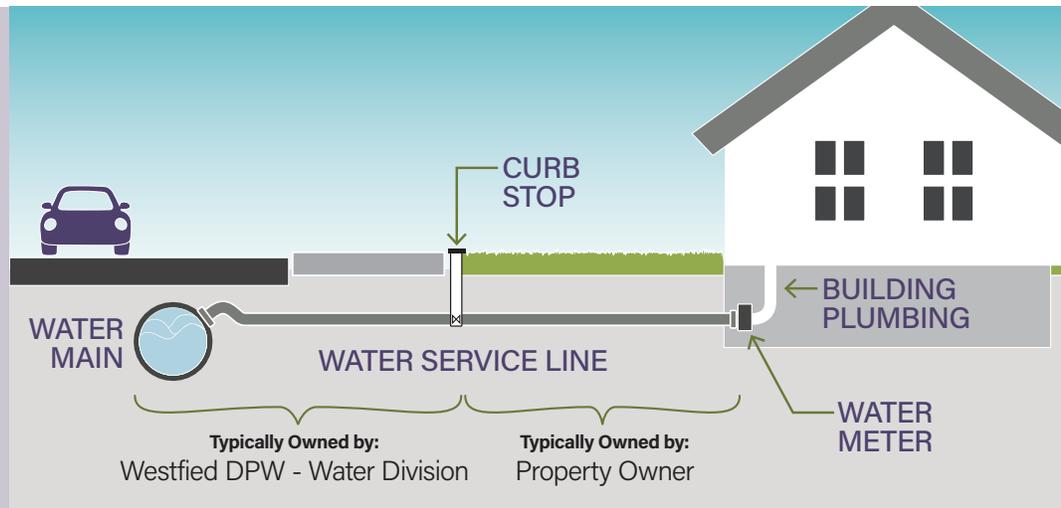

The Westfield DPW - Water Division is coming to check your service line soon!

The 2021 U.S. Environmental Protection Agency Lead and Copper Rule Revisions require all water utilities, including Westfield DPW - Water Division, to prepare an inventory of water service line materials to learn if the water system has any lead or galvanized steel (which may have lead) water service lines.

The Westfield DPW - Water Division has completed our initial inventory and is updating our records for properties with service lines of unknown materials. **The material of the customer-owned side of your service line is Unknown.**

The Westfield DPW - Water Division is committed to protecting public health by providing clean and reliable drinking water to its community. Knowing the materials of your water service line helps us do that!

To confirm your water service line's material, we will be coming to check the pipe coming into your house. This check will tell us the material of your customer-owned service line, including if it is lead or galvanized (which may have lead).

The day we visit your home to check your line, we will leave information with you telling you the material of your service line.

If we do find lead or galvanized steel service lines, the Westfield DPW - Water Division will give you steps to protect your health.

If you do not have a lead or galvanized steel service line, you do not need to take any further action.
